

LEBANESE UNIVERSITY FANAR CAMPUS EXTENTION PROJECT

ACCESSISIBILITY & CIRCULATION

INTEGRATION WITH THE EXISTING CAMPUS

Complementing and aligning with the existing campus grid, which guided the project's main layout.

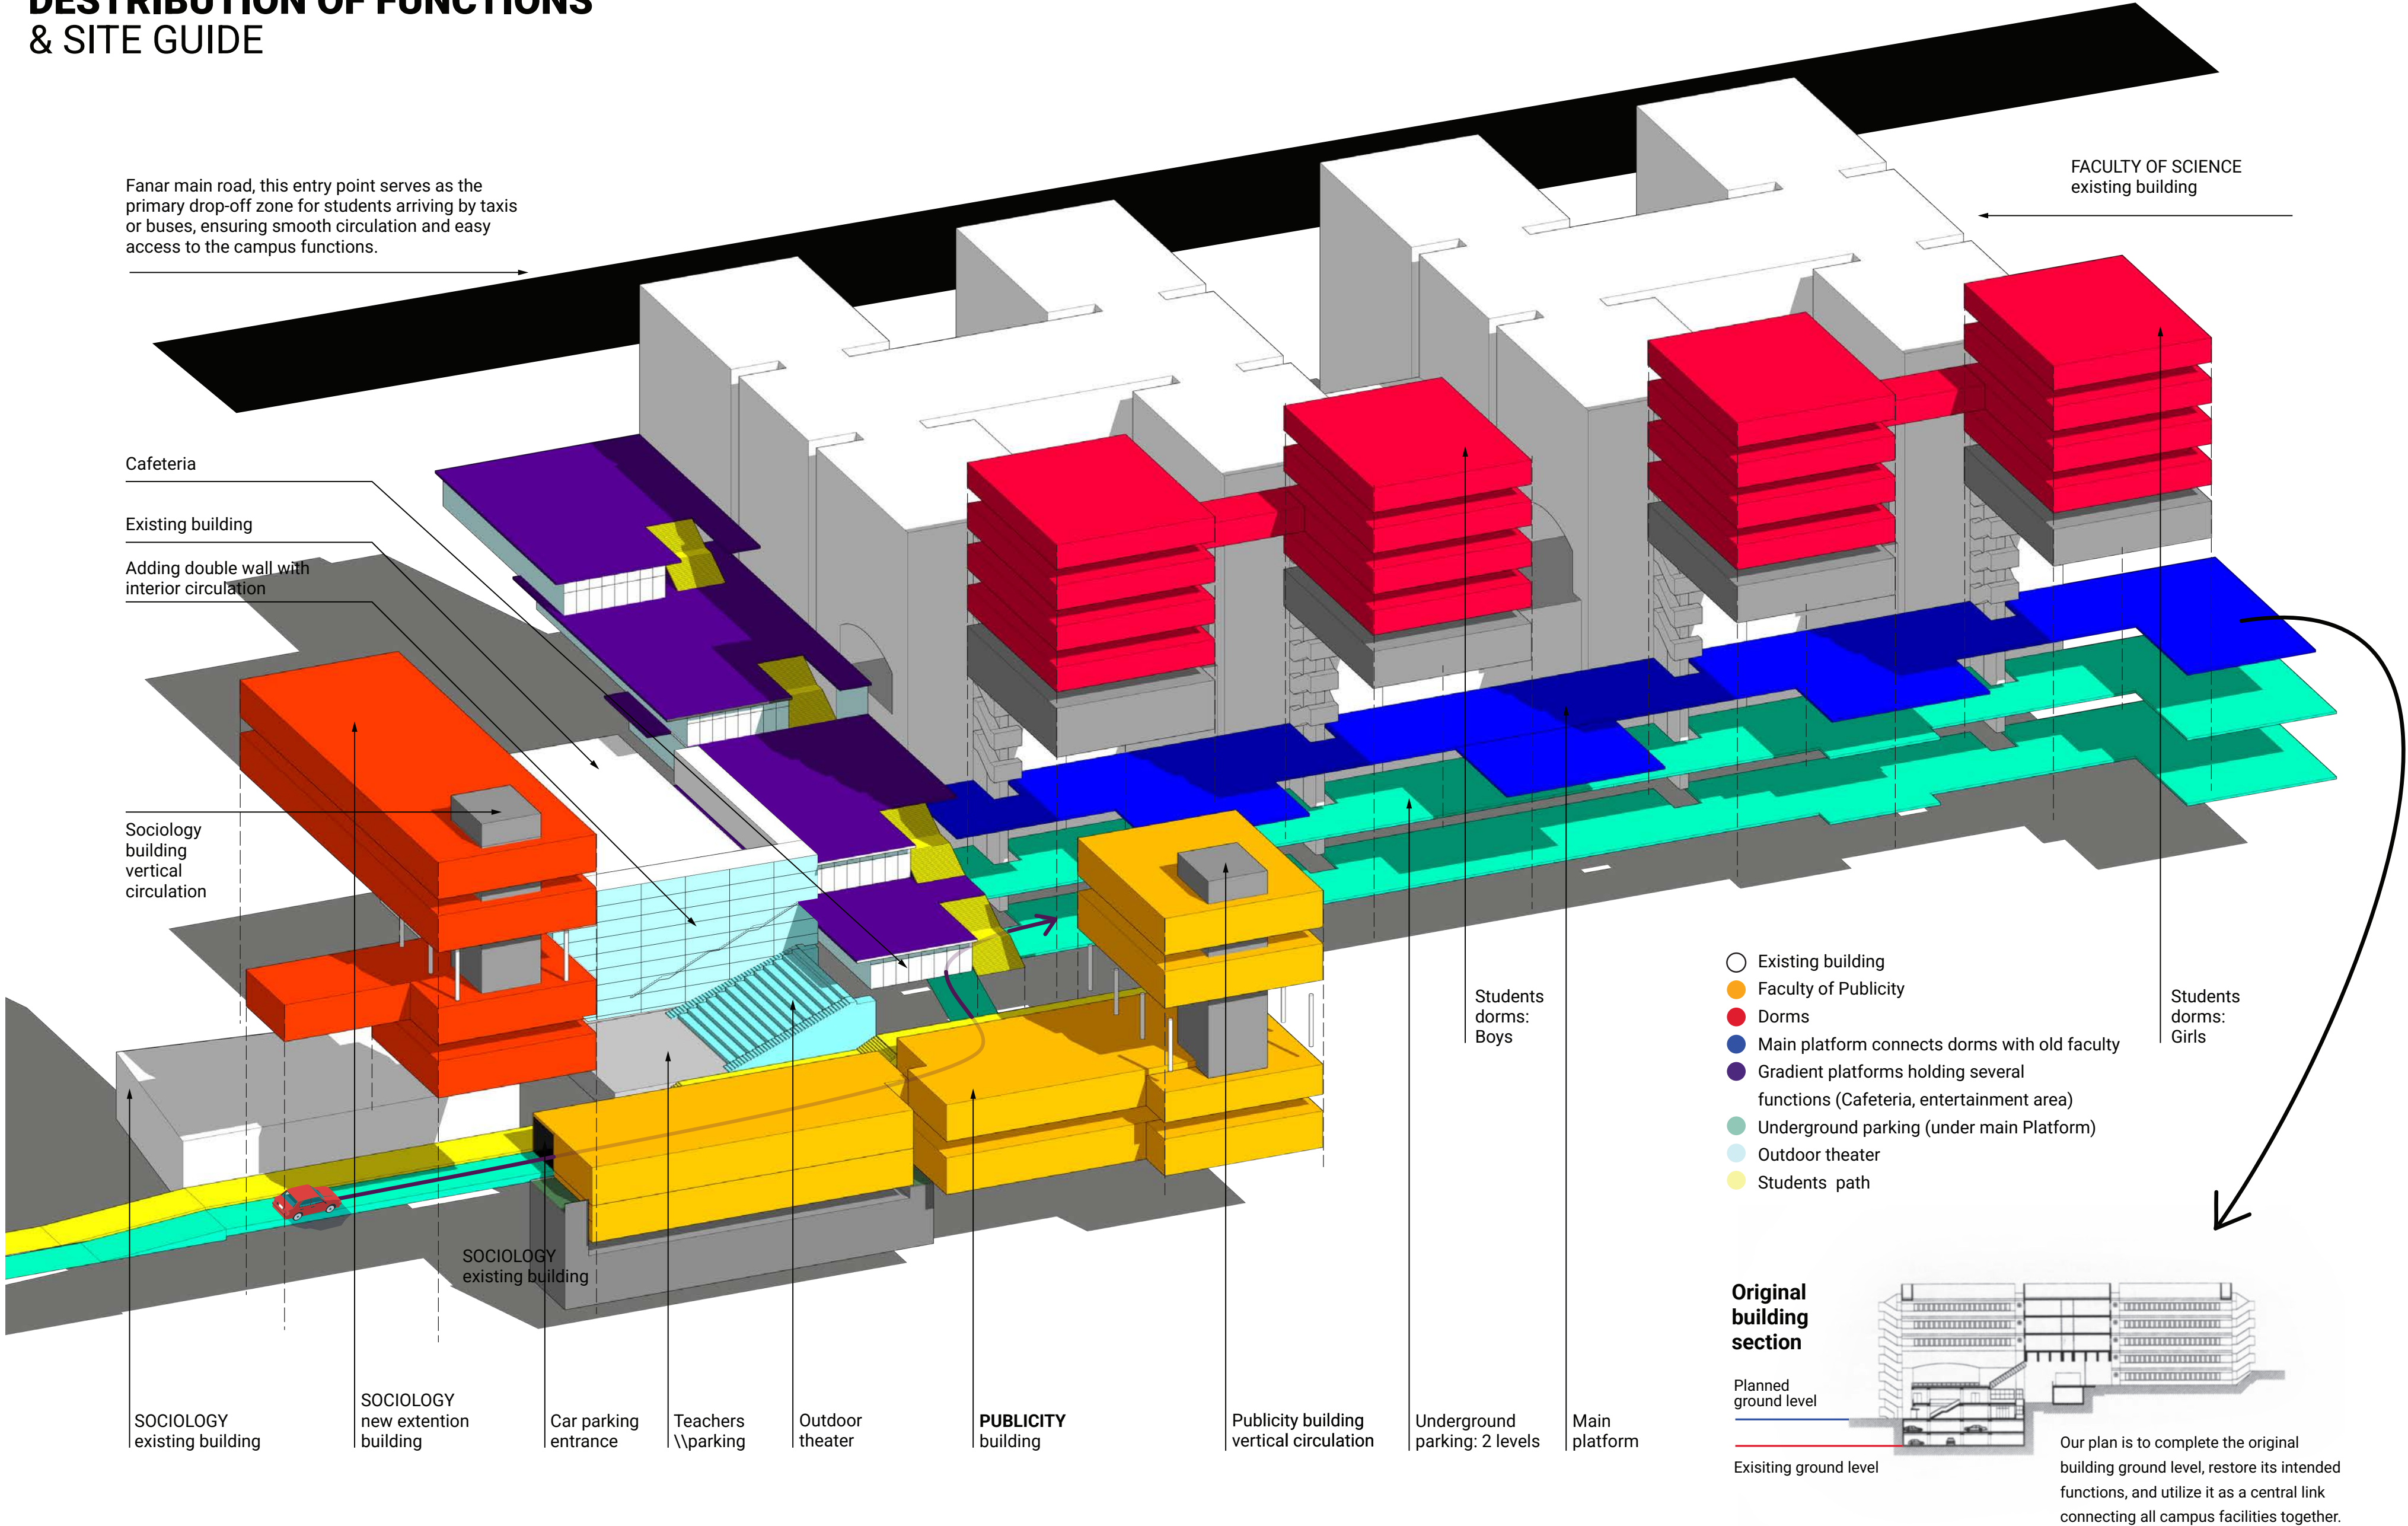

P.00 Mass Plan

PROJECT MAIN AXES

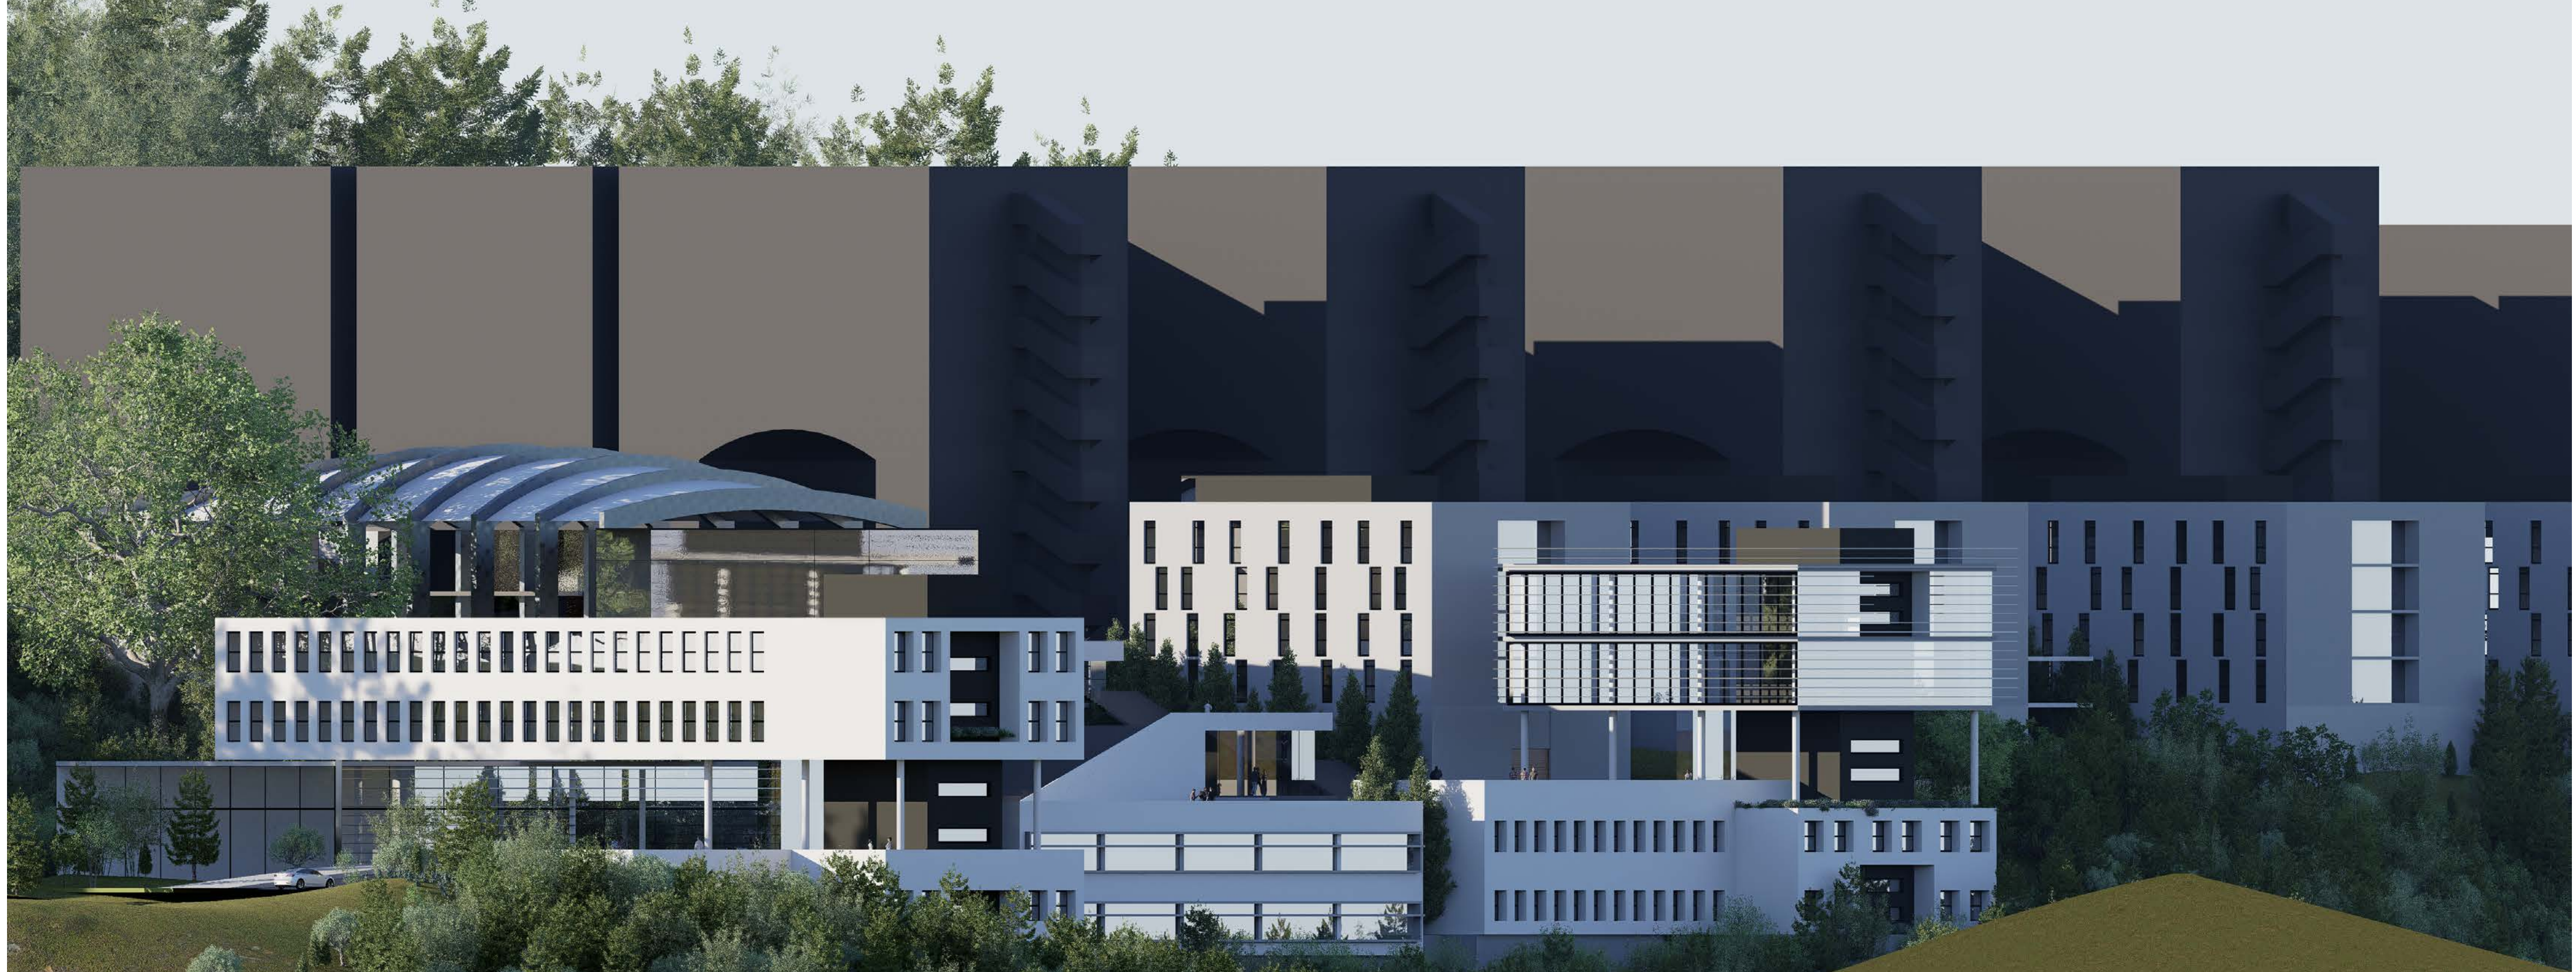

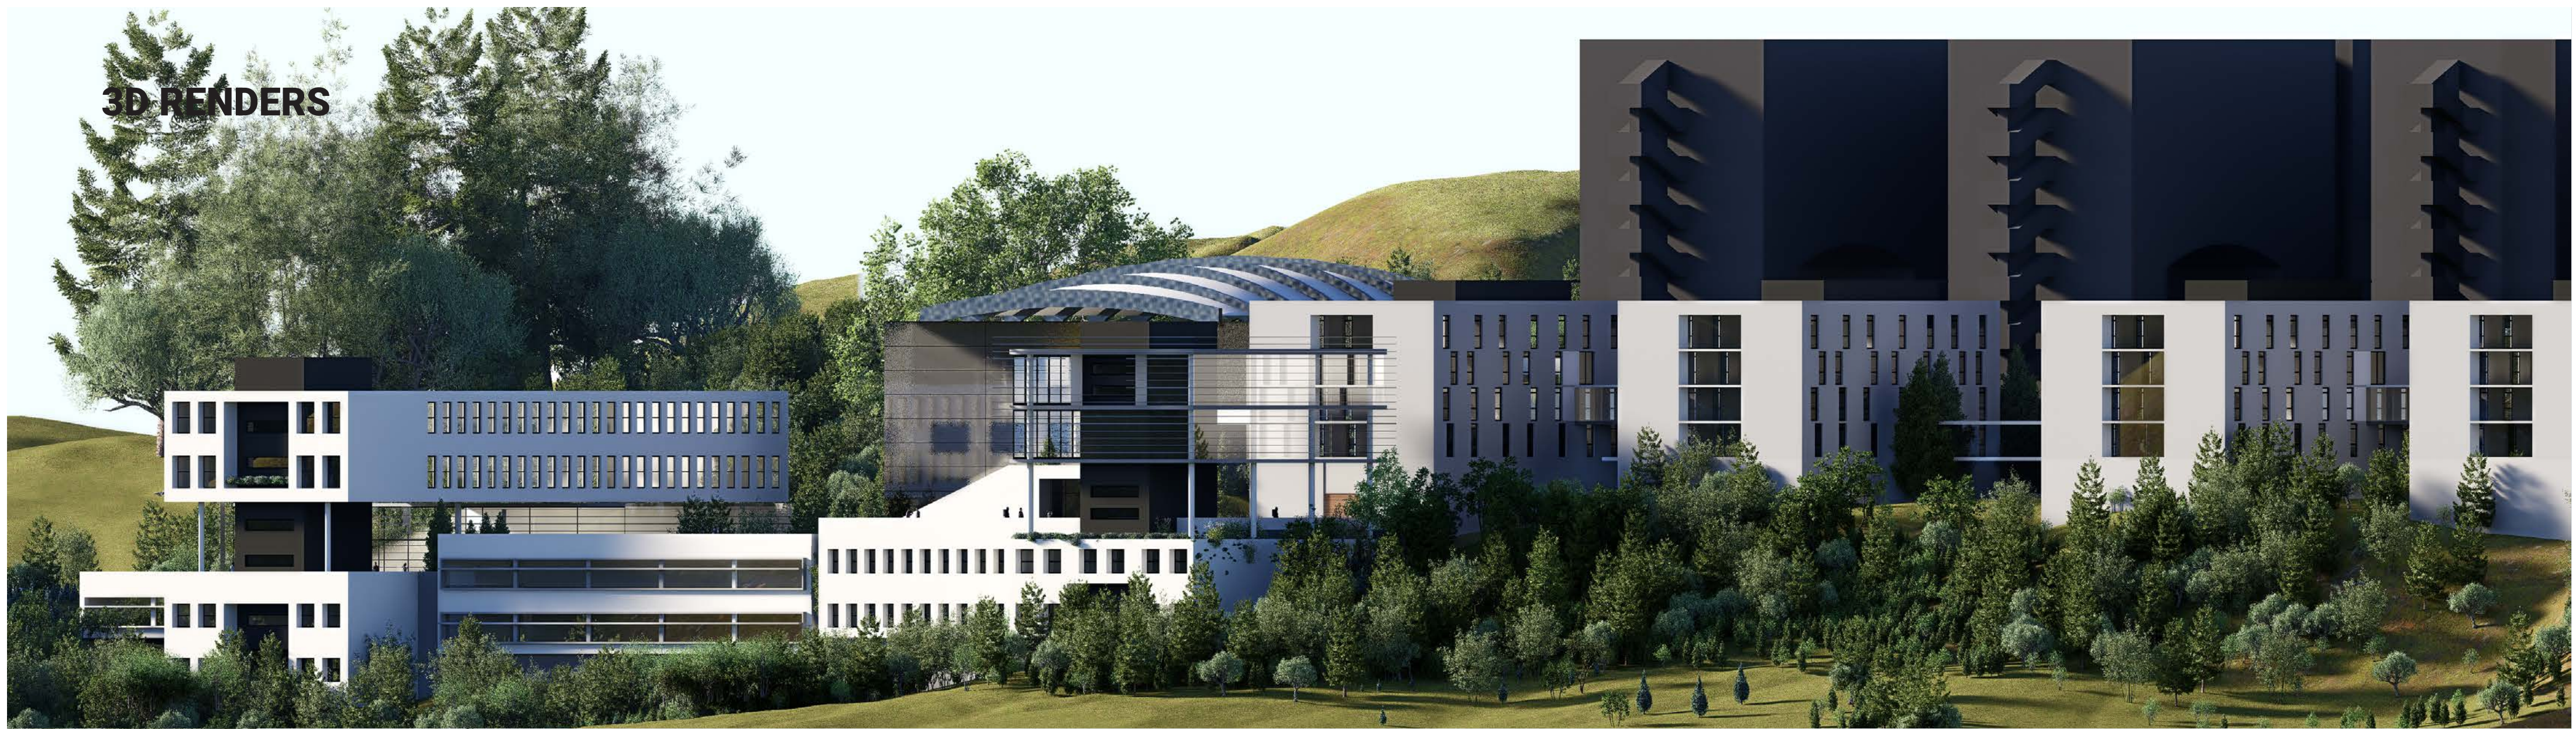

The project is structured along main circulation axes that weave through the site, linking all campus zones together. These axes act as active communication corridors, not only ensuring functional connectivity but also encouraging social interaction and spontaneous encounters between students across different faculties

SUSTAINABILITY & ENVIRONMENTAL STRATEGY

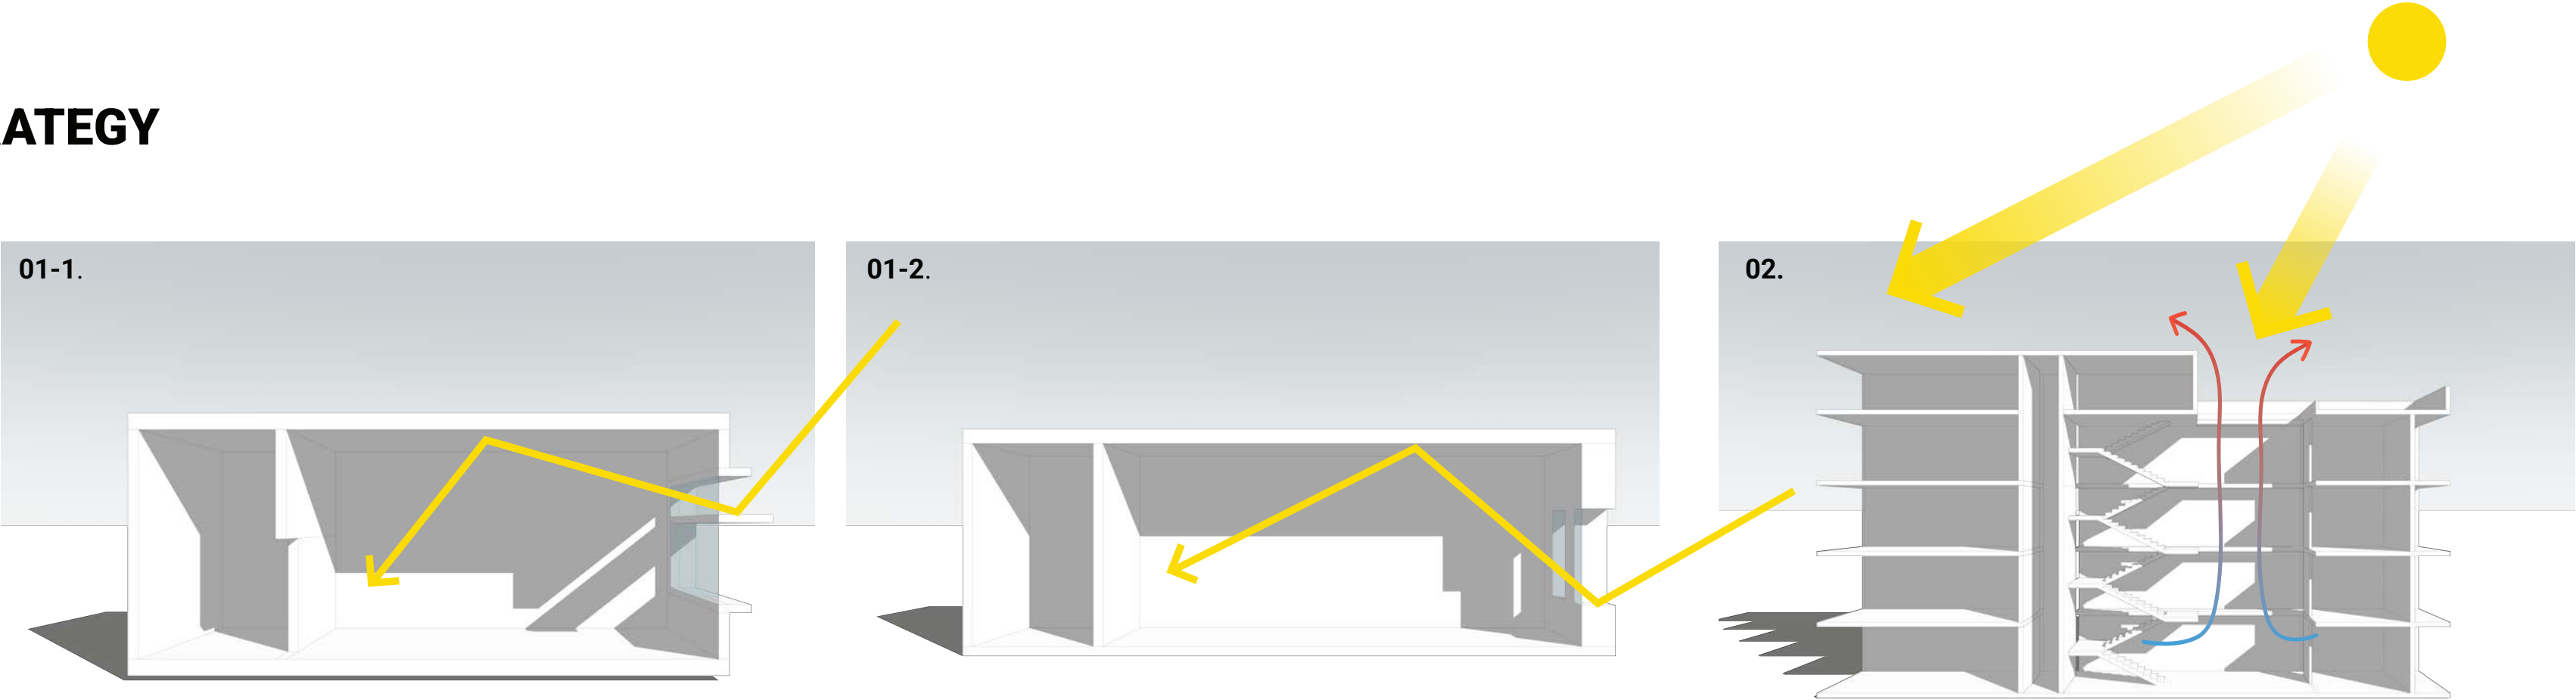

01. INTEGRATING LIGHT SHELVES AND THICK WALLS IN CLASS ROOMS

01-1. The light shelves help reflect natural light deeper inside, reduce glare, and limit artificial lighting needs — improving comfort and energy performance.

01-2. The thick walls act as thermal buffers — they regulate temperature, reduce energy use, and create shading and depth along the façade.

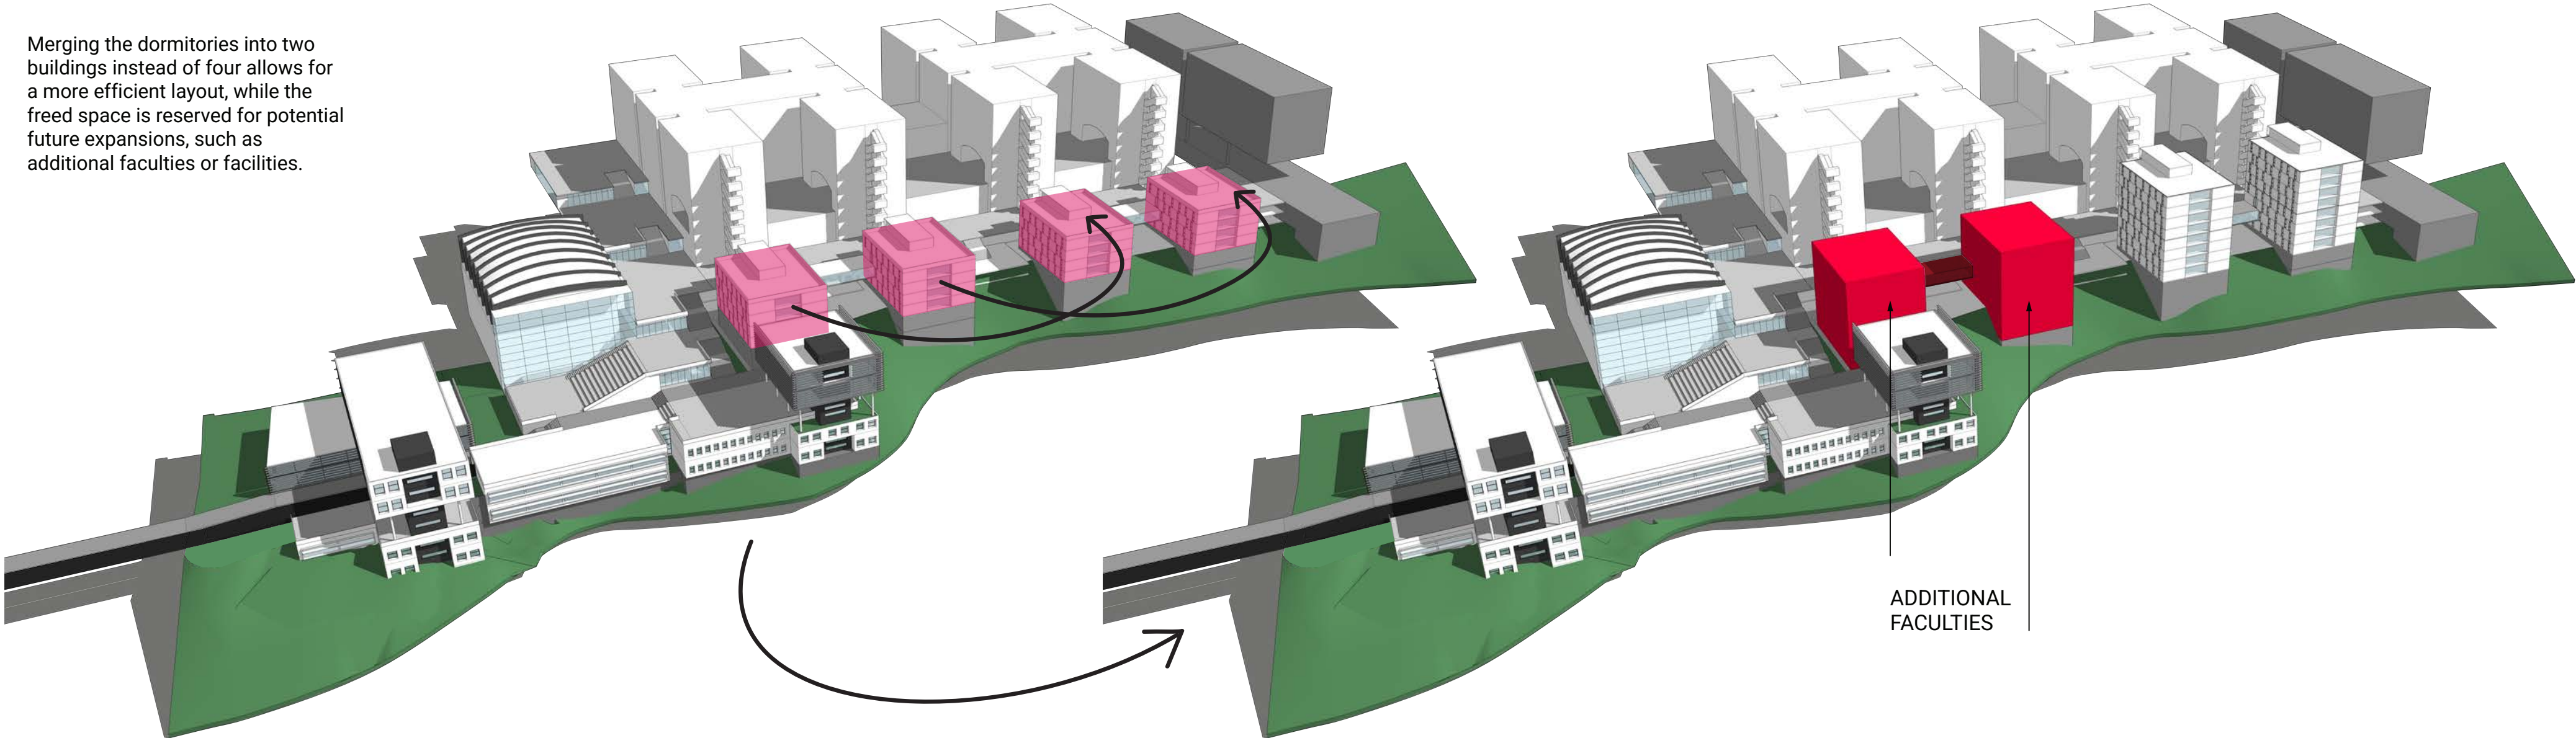

02. ATRIUM INTEGRATION IN DORMS

The central void enhances natural light and ventilation, improving comfort and reducing energy use while creating openness and connection within the dorms.

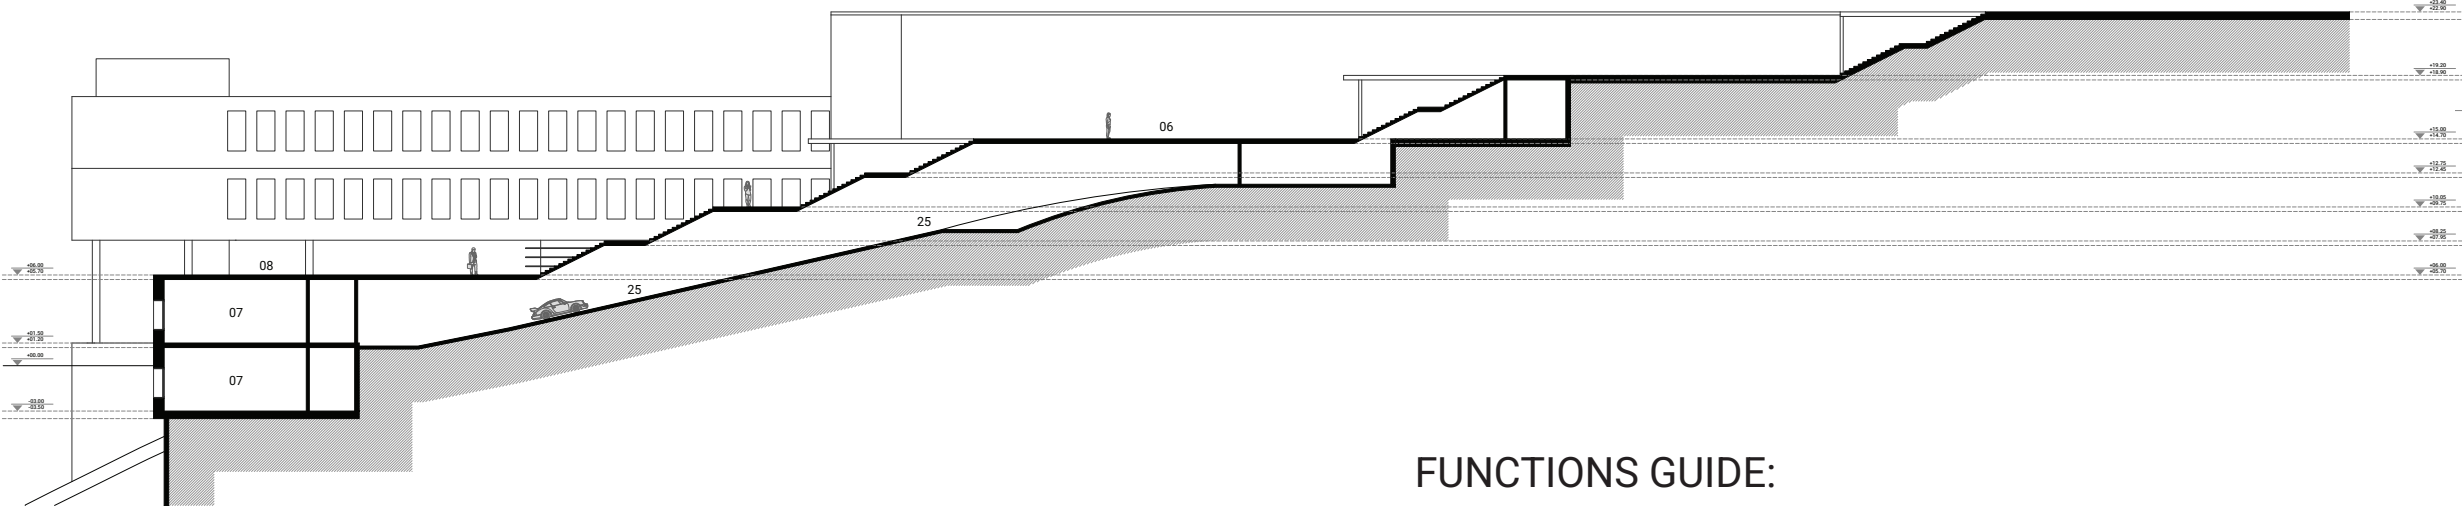

A PLAN FOR THE FUTURE

Merging the dormitories into two buildings instead of four allows for a more efficient layout, while the freed space is reserved for potential future expansions, such as additional faculties or facilities.
